

Manon Bonnot – Firrow

Video game developer

I'm Manon, a developer and an artist, passionate about science, video games and anything related, directly or indirectly, to geek culture. I develop games, I create drawings for my games or for commissions I have many other hobbies such as hiking, RPGs, or board games.

After obtaining my scientific baccalaureate with a mathematics specialization and European section in 2019 with highest honors, I completed a Computer Science DUT at the University of Annecy between 2019 and 2021 before completing a University Diploma in Level Design in 2021-2022. Finally, I recently completed my Master 2 in Video Game Engineering at Gamagora. Over the past two years, I have had the opportunity to do several VR development internships as well as an internship and a fixed-term contract at Ubisoft Ivory Tower, where I had the opportunity to work on seasons of *The Crew Motorfest*

I am currently looking for a position in video game development, focusing on C++, Blueprint, C#, Unreal, or Unity.

The background of the page is a light beige or cream color with a subtle, textured pattern. Overlaid on this background are several large, detailed illustrations of mechanical gears and cogs, rendered in a dark, muted green or brown color. These gears are of various sizes and are positioned around the perimeter of the page, creating a steampunk or industrial aesthetic. In the center of the page, there is a faint, glowing lightbulb icon, suggesting ideas or innovation. The overall design is clean and professional, suitable for a technical or creative document.

Development work of games

Over the past year, between 2025 and 2026, I had the opportunity to complete a second internship as well as a fixed-term contract at Ubisoft Ivory Tower and work on The Crew Motorfest project. I took part in creating seasons 7 and 9 on the themes of Ferrari and Nascar.

I carried out many varied tasks, both on the game (gameplay and audio) and on the tools used for production. Here is a selection.

1.

TOOL DEVELOPMENT FOR THE BABEL GAME

For my first task, my objective was to help our store manager to add the cosmetics sold to players each week of every season in the Babel engine. To allow automatic data entry and avoid errors, I wrote a C# script that performs several steps:

We then obtain the creation of all periods with their start and end dates and their name, as well as the creation of the list of cosmetics that will be on sale during it.

Debug messages to track the filling of the archetype

2. ADD A POP-UP WINDOW AT THE START OF THE RACE

During April 2025, we carried out a play session to test the game's future additions. We had therefore played several events, and one of them consisted of using a car with a manual gearbox. Many collaborators (including me) had not understood that gear shifting was not automatic and therefore were unable to complete the event. I was then tasked with adding a pop-up window at the start of the activities asking the player to manage gear changes.

I then created a class that reproduces the structure and operation of the existing triggers and added it to the system.

I created a function to check whether the option I'm looking for is in the list of options for the "Summit Contest" event (weekly challenge).

Among the class's members, there is a property that references the trigger in the engine.

Among the trigger's functions, the OnRaceStart() method checks whether the "Gearbox" option—which corresponds to the manual transmission—is present in the list of options for the summit. If it is, a pop-up is displayed; otherwise, nothing happens.

This results in a window display that provides the player with the information needed to successfully complete the event.

3.

IMPROVEMENTS TO SEVERAL IMGUI WINDOWS

At the request of the Dev Tests team, I also had the opportunity to improve several ImGui windows used to display and manipulate data such as periods, vehicles, or cosmetics during the game. The display was not practical because the elements were most often shown in the order of their IDs entered in the engine. The goal here was notably to group the dates and sort the names in alphabetical order.

Among the windows I improved, here is the one grouping all the vehicles present in the game, with the categories on the left and the models on the right:

The categories and models are managed by structures containing an ID, a name retrieved via the ID, and an overload of the operator « < » allowing names to be compared.

The container is made up of a first map with the vehicle category as the key and, as the value, a second map with the vehicle model as the key and its associated value. Rather than entering only the IDs, we instantiate the elements using our structures so that our elements are automatically sorted by their retrieved name and compared to the others.

Then we iterate through the container to display the elements.

This solution allows to keep the map system and sort them during filling, since a map cannot be sorted once filled.

4. IMPROVEMENTS TO THE AUDIO MANAGEMENT SYSTEM

This feature is the most complex one I had the opportunity to implement during my internship. This work had a project-side goal, which was to improve the audio management system within Babel. It also aimed to train me in several concepts such as multithreading techniques and to help the audio programmer who assisted me to gain in pedagogy.

First, here is a simple diagram of how sound management works:

An audio source is transmitted to the listener managed by the Wwise sound engine, which will apply processing to the sound thanks to an audio mixing node called an auxiliary (see global legend below), chosen according to its effects. The modified sound is then transmitted to the different Game Objects linked to the auxiliary used previously, which will then emit the sound at emission points audible from a reference point (example: player).

The work carried out here therefore makes it possible to avoid a sound processed by an auxiliary being applied by several different Game Objects associated with that auxiliary. The diagram on the next page illustrates the differences before and after the implementation of Clusters.

Global diagram legend

x dB Audibility reference point (listening point)
Total perceived volume (+)

x dB Audible emission zone
Perceived volume (attenuated) at the listening point

Inaudible emission zone

Game Object (GO) + Auxiliary

Auxiliary (Aux) : Audio mixing node with effects and attenuation properties that can be associated with a Game Object.

Before clusterization

After clusterization

With the creation of clusters to group emission points, the application of each audible emission point is carried out by a single entity linked to the auxiliary. With this, I developed the entire "debug" part to display the Game Objects and the Clusters on the map.

5.

MY OTHER TASKS

Among my main achievements for season 9, I helped set up a feedback sound for slipstream (the suction phenomenon caused by the car in front of the player's car). In the image below, the sound is represented by the debug message at the top left (green = the sound has been playing for x seconds).

I also added a steering wheel rotation sound for cars and RCs (remote-controlled cars), linked to the normalized yaw rotation shown by a debug message during development. The feature is available in the RC Frenzy playlist.

Finally, among other things, I took part in the debug period before the launch of season 9 as well as the improvement of the store bundle monetization system.

Develop at Ubisoft : Mira's Escape

Having not found an internship to validate my second year of Master's, I decided to re-enroll at the university for the 2024/2025 academic year. In October 2024, I managed to find an internship in VR development with Unity and, in parallel, completed the "Develop at Ubisoft" program. This allowed me to create a game in 4 months on the theme « **Limited resources** » with advice from a developer at Ubisoft Annecy who played the role of mentor.

Mira's Escape is a 2D platform and exploration game made in Unreal Engine 5.3 with Paper 2D in C++. The player takes on the role of Mira, a small alien exploring the universe who has crash-landed somewhere in an unknown steampunk city. She then sets out in search of the three gears needed to restart her spaceship, which were confiscated from her. However, she must pay attention to the passing time. Her ship's self-destruct mode has been programmed to activate in 24 hours, and it is her only way to get back home.

To match the theme, everything that can help the player in their quest is a limited resource. This is also the case for the interface, with elapsed time, the number of gears collected, as well as the map, which the player can therefore obtain during the game.

Limited resources available

The player must explore the map to find the gears and can use the various bonuses found in chests. Here, he picks up the map, which then appears in his HUD.

In this game, I therefore handled the design and programming, as well as part of the assets: the character and the chest, along with their animations, the doors, the ladders, and the final airship (see the image opposite). As for the other graphic elements, as well as the sounds and music, I used the work of several creators credited in the game's credits. Finally, my mentor enabled me to acquire all the necessary knowledge in C++ to create the game, but also to improve my code and the project's structure.

Class structure of game elements

MAP CREATION

The map is generated procedurally, both for the structure of the buildings and for the placement of the chests, whose contents are randomly drawn. Generation uses a seed system to help with debugging and is done in 4 main steps:

- 1) **Creation of a tilemap and a layer,**
- 2) **Addition of buildings,**
 - a. Addition of **floor tiles** on the last row,
 - b. Setting up the base of the buildings using a probability system for placing a building tile (start, middle or end) and a rule for their minimum and maximum width,
 - c. Vertical construction of the buildings with the same system and a minimum height to reach and a maximum height not to exceed.

3) Adding interactive objects,

- Setting up **ladders**: calculating the probability of placing a ladder piece on a platform based on the isolation of the latter (see the image on the right). When the piece is placed, an “ladder” tile is placed underneath until reaching a floor,

- Setting up **doors**: if the current tile is on a building without doors and on a floor, we calculate the number of spaces of 3 empty tiles (space equal to the width of the door) and if at least one space is available, we randomly choose one and place a door,
- Setting up **chests**: we randomly draw x and y coordinates and as long as the tile is not on a floor we add +1 to y (modulo the grid height) and if it is on a floor but is on another object, we add +1 to x. If the coordinates are correct, we place a chest.
- Placement of the **end airship balloon**: We choose $x = 0$ or $x = \text{grid size} - 1$ and adjust the y value by adding +1 as long as the tile is not on a floor with no other object on it. We then place the balloon, which serves as the game-end trigger,

- Placement of the player spawn**: we delete the initial player instance and, in the same way as for the previous objects, we choose coordinates that we adjust so the player starts on a floor, then place it before linking it to the controller.

The project source code is available here:

https://github.com/Firrow/Game_DevelopAtUbisoft

The game is available on my itch.io page: <https://firrowmb.itch.io/miras-escape>

During my first year of Master's, I was able to complete an internship consisting of developing on Unreal Engine 4 serious virtual reality games on Meta Quest 2 for businesses. These experiences aim to train new employees in different professions.

Among the 2 projects I completed, Auxilia was the main one. In this experience, the player must, in the first module, come to the aid of a service beneficiary. Several questions about the situation are asked, and a simulation of placing her in the recovery position is offered.

Management of the recovery to the recovery position through detection of the player's actions

A function that loads events based on the current question. When necessary, it plays a sound, teleports the player, or performs other actions by calling the appropriate methods.

Module 2 : Gérer l'agressivité chez un bénéficiaire

Situations :

Comment vous présentez-vous ? ☒ Je suis et attends une réponse avant d'arriver

Comment réagissez-vous face à la bénéficiaire agressive ? ☒ Je me présente et lui explique que je viens faire le soin

La bénéficiaire refuse le soin ☒ Je détourne son attention en changeant de sujet

Quelle activité proposez-vous ? ☒ Je lui propose de discuter de musique et de la famille

Après discussion votre bénéficiaire ne change pas d'avis ☒ Je contacte mon responsable

Vous remettez le soin au lendemain ☒ Je laisse une collation, un verre d'eau et je fais une transmission

Que faites-vous avant de quitter le domicile ? ☒ Je vérifie la sécurité des lieux

Sécurité du domicile 2/3

Fils électriques au milieu du passage ☒

Produits ménagers dangereux non rangés ☒

Invictus

Invictus is one of our final-year Master 2 projects at Gamagora, developed with Unreal Engine 5. We were a team of 17 students including 5 developers, and our goal was to make a game in 3 months.

In this game, the player takes on the role of Avelyn, a young woman who has recently died and wakes up in the world of the dead, possessed by Ika, a serpent demon. To free herself from his control, she must team up with him to recover his body.

INVICTUS

In this project, I created several elements, including the core mechanic: transformation. Depending on the player's actions, Avelyn either takes her human form and can attack from a distance or takes her demon form and can attack in melee. Each version of the character has its own BP as well as its own animation graph. The character currently controlled by the player is assigned in a parent class of BP_Avelyn and BP_Ika called BP_Player. I also developed certain gameplay mechanics such as shooting and the madness system enabling transformation.

For the shooting mechanic, first we check that the player is not already shooting before launching the animation, update the number of bullets and create the firing effect using the Line Trace By Channel system. The enemy hit then sees their HP decrease.

In addition, I helped set up the project architecture, integrated the modeled and rigged characters created by the graphic designers, and added their Mixamo animations into the game. Finally, I advised and helped my classmates from the different teams integrate game elements, whether other mechanics, certain UIs, or interactive environments.

The game is available on itch.io: <https://gamagora.itch.io/invictus>

Overail (in development)

Use of Bezier
curves to
create the
tracks

Overail is a 2D battle royale in top-down view where the player takes on the role of a train that must destroy its opponents in order to be the last one alive on a rail network. To do this, it can choose the direction it will take at the next switch, shoot at the other trains, and use the items it picks up. To improve my skills on Unity, I wanted to carry out all the stages of the game's creation myself, from the GDD to putting the game online once it is sufficiently complete. A community Discord will be available soon to follow the game's development.

Link to the first prototype version releases: <https://github.com/Firrow/Releases-Overail-Prototype>

Magic Doom

Magic Doom is a game developed on Unity as part of a module in my Master 2 at Gamagora. The player, who plays an old sorcerer, must protect his pentagram and his cauldrons from waves of monsters that arrive in his laboratory. Thanks to his cauldrons and the gems he can collect by killing the monsters, he can craft potions to protect his pentagram more effectively.

In this project, I implemented the gameplay logic with the gems and cauldrons and created the player and enemies. I designed and created the different screens, the interface, and reused the enemies I had previously designed for Light Up.

Due to lack of time, I had to use assets found on the internet, which I retouched when necessary. Using the different sprites, I created the animations for the player, the enemies, the spells, and the cauldrons breaking. I also added the music and sound effects, which I sometimes modified to better fit the game.

The game is available on my Github as well as on my itch.io:
Project: https://github.com/Firrow/Game_MagicDoom
Release game: <https://firrowmb.itch.io/magic-doom>

Roll on the dancefloor

Game made in 2 days on Unity by a team of 4 during the Game Jam « GMTK 2022 » on the theme « Roll of the dice ». On this project, I helped with game design, handled the artistic design part, and helped with development by creating the various menus as well as audio management.

In this game, you play as a die moving across a dancefloor made up of tiles of different colors. The number displayed on top of the die, as well as the color of the tile it is on, triggers effects that make moving the die harder or easier through various effects. Your goal is to roll as far as possible on the dancefloor. Let's groove!

Release game: <https://osun.itch.io/roll-on-the-dancefloor>

Light Up

Game made in Unity during my year in Level Design DU at Gamagora with a classmate. The goal of the game is to survive as long as possible in a cave filled with monsters by taking them down using the weapons found by the player. I created all the game's drawings and their animations, as well as the screens, the interface, and the management of options and the music and sounds, which I sometimes remixed. I also modified the movement system to allow the player to choose their controls in the options.

Find the final game as well as the code on my Github and on my itch.io:

Project: https://github.com/Firrow/Game_LightUp

Release game: <https://firrowmb.itch.io/light-up>

MENU PRINCIPAL

QUITTER LE JEU

The light around the player varies depending on the character's health. It was created using the « Render Pipeline » plugin. The higher the player's health, the bigger the light and therefore the easier the game is.

To conclude our imperative programming module in C and in SFML (C++) during our first year of DUT, we created as a group a small video game during a special week. During those five days, I created the randomly generated maze system, looked for the various assets and designed the main character and the implementation of his different expressions. The game was made without a game engine; everything was developed only in C and SMFL.

In this game, the main character must move through a maze plunged into darkness. His goal is to find a path to the exit, while collecting as many stars as possible in order to earn the most points possible. However, he must be careful not to be caught by the terrible Leviators. The hero can nevertheless find a Master Sword in order to kill the monsters and accumulate even more points.

The background of the page is a light orange gradient with a subtle, textured pattern. Overlaid on this are various mechanical gears and cogs of different sizes, rendered in a dark, muted green color. These gears are positioned around the edges of the page, creating a steampunk or industrial aesthetic.

Level Design

During my year in Level Design, we had many courses to learn how to use game engines, notably Unreal Engine 4. Here, we had to create a coherent level with many interactive elements. So I created a level made up of a house, a river with its bridge, an old farm, and a tower in which a princess is imprisoned. The player's goal is to rescue the princess. To do this, he must cross the river using the lift and the locked doors, avoid the guard present in the center of the level, go to the old farm, also guarded by a guard, to retrieve a key by going through the roof, and head to the tower.

Some pieces of the
Level Blueprint
(this level was my
first contact with
the system of
Blueprint)

Pharaoh, Curse of the old Gods

For the creation of the game « Pharaoh, Curse of the Old Gods », a metroidvania set taking place in an Egyptian pyramid, I worked as part of a team on creating the map as well as the rooms that make it up. The game features a pharaoh who has suffered a curse from the gods following his rule as a dictator. After his death, he wakes up in his tomb and wants to escape it, but first he must recover his vital organs contained in canopic jars scattered throughout the four corners of the pyramid. I proposed the following prototype, some parts of which will be reused in the final map.

The different areas are represented by 4 colors and by the canopic jars, which correspond to a skill to recover in order to escape the pyramid at the end of the game.

The game is available here: <https://gamagora.itch.io/pharaoh>

Here are some examples of rooms sometimes integrated into the final game and created on Dungeon Scrawl:

0 - Niveau tuto :

Mur cassable

Apprend au joueur la hauteur max de saut

Apprend au joueur la longueur max de saut

Le joueur ne peut pas sauter aussi haut et doit faire le tour

⇒ Apprend au joueur à casser des murs craquelés, le saut et sa longueur maximale

Saut + grappin

a) Salle 1 (suite porte C1) :

⇒ Salle avec une plus grande difficulté

Le joueur doit utiliser les bandelettes acquises dans la zone 1. Selon son sens de progression, le joueur ne fera pas la même suite d'actions (voir schéma).

Concernant la zone de la caisse, si le joueur vient d'en bas à droite, il pourra attraper la caisse avec ses bandelettes et tirer la caisse sur les pics en bas à droite et pourra l'utiliser pour monter sur la plateforme et continuer sa progression. Si le joueur vient d'en haut à gauche, il pourra tirer la caisse sur les pics en bas à gauche et pourra dans la suite du jeu l'utiliser dans les deux sens pour monter sur la plateforme et continuer son chemin.

PS : à voir si on oblige le joueur à tirer la caisse à droite ou à gauche ou les deux, en fonction du chemin qu'on souhaite qu'il prenne.

Notes: These few rooms have been corrected, notably in terms of the metrics and their layout to match the rest of the map.

I/ ZONE 1 (rouge)

a) Couloir 1

⇒ Apprend au joueur à se servir du dash seul et à le combiner au saut

The background of the page is a light beige or cream color with a subtle, textured pattern. Overlaid on this background are several faint, stylized illustrations of mechanical gears and a lightbulb. The gears are of various sizes and are positioned around the perimeter of the page, with some overlapping the text area. The lightbulb is located in the upper right quadrant. The overall aesthetic is that of a vintage or steampunk-themed document.

Drawings

Video games

Hollow Knight

15/06/2020 – 16/06/2020

Representation of the Knight in a chest and his shadow. I wanted to create a drawing for myself that paid tribute to one of my favorite games. The style of the drawing takes after that of the game while the scene is simply inspired by certain passages from the game. The goal was to depict the character's shadow in an impressive way and create a contrast with the little ghost that seems more harmless. The idea for this depiction came to me during one of my playthroughs when my character was stuck in a small chest. Drawing made in Krita, using as reference an image taken from one of my playthroughs of the game.

Edward Kenway – Assassin's Creed IV: Black Flag

13/08/2017 – 29/08/2017: Commission

Fan art of an image taken from the promotion of the game Assassin's Creed IV. Commission made for a birthday, depicting the main character of the game. This drawing takes up the promotional and official image of the game.

“Your best friend” – Undertale

27/06/2021 – 28/06/2021

Small drawing paying tribute to the first scene of the game « Undertale » as well as to the character Flowey, the main antagonist of the latter, who will turn out to be a monster. Drawing made on Krita with my sketch done on paper as reference.

House of P'tits Kmin

14/07/2021 – 16/08/2025

This drawing is a wimmelbilder made in Krita, depicting a house inhabited by children from the Pikmin, Hollow Knight, Zelda and Final Fantasy franchises. Each child has a personality illustrated by their room, which has the same color and/or the same design as their original universe.

Kasai's room

For example, Kasai's room (red pikmin) is a red « onion » that presents him as naive and kind, while Denki's room (yellow pikmin) is a yellow « onion » that shows us he is hot-headed, not very obedient and messy. Finally, common rooms complete the house and illustrate several funny scenes.

Denki's room

You can find this work on my Instagram @firrowmb right here.

The works of Mizu

August 2025 - ...

To help my partner create a deckbuilding game still connected to the P'tits Kmins, I am making several parodies of famous works of art to illustrate certain cards. In the game's lore, Mizu (blue pikmin) is an artist who paints pictures usable during the game. All the paintings are entirely remade in Krita.

Mizu's Vitruvian Man

08/25 – 09/25

Parody of Leonardo da Vinci's Vitruvian Man

Leonardo da Vinci (1492)

Mizu's Scream

09/25 – 03/26

Parody of Edvard Munch's The Scream (1893)

OTAKU POWA

09/2018 – 20/08/2019: Commission
featuring characters from various
manga and anime.

Daenerys Targaryen – Game of Thrones

13/07/2018 – 31/07/2018: Commission

Beck Kustoms F132

30/02/2020 – 11/06/2020: Commission

BECK
面體

Mermaid on her rock

27/07/2020 – 10/08/2020: Commission

As the order description was not very precise, I wanted to depict a mermaid with a soothing, restful appearance, enjoying the calm of the sea around her. A few small ornamental additions made with a pen were then requested before delivery.

Other creations

Star Wars

17/06/2020 – 26/07/2020: Commission

Poker Skull

20/05/2017 – 23/05/2017 : Commission

Miscellaneous small drawings – 2020 / 2023

My role-playing character

The background of the page is a light beige or cream color with a subtle, textured pattern. Overlaid on this background are several large, detailed illustrations of mechanical gears and cogs, rendered in a dark, muted green or olive tone. These gears are positioned around the perimeter of the page, with some partially cut off by the edges. A bright, circular light flare or lens flare effect is centered in the upper-middle portion of the page, creating a soft glow that fades out towards the edges.

Others

Cosplay Ezio Auditore da Firenze – Assassin's Creed II

Handmade costume made in August 2017 with a family member, which I had the chance to wear several times at conventions, notably Japan Expo and Japan Touch.

Mockup site for a Moto Club

Mockup created for a potential future site commissioned by a Moto Club in my region. The site was never able to be built due to financial reasons.

P.S.: The menu fields below are not in their final position but are shown this way to display all the site's features.
